Market Strategy (Risk Management)

DEFENSE: The current beta is 25.8% vs. the benchmark of 100% down from 26.4% last week. Someone asked me last week about the yield curve and that it's not inverted in Japan, China, Germany, UK...and so on. With the US dollar the reserve currency of the world and funding rates that are highly correlated to the LIBOR markets, the US yield curve matters more than any other. But we do have over \$10T in negative yielding debt. If anyone thinks the economy is healthy with the reliance on QE, ZIRP and NIRP they really don't get it. The world is fragile and now money is chasing US Debt at 105% of Debt to GDP and trillion dollar plus deficits as far as the eye can see. Those calling the end of the bond bull are likely wrong until the Fed and other CBs officially monetize the debt for good. Stocks probably won't like the next round of liquidity eventually.

Equity Allocation Country/Sector Trades

Late in the cycle with the yield curve now inverting, you MUST err on the side of playing defense as we have once again. Early forecasts for US Q1 GDP are about 1% and the effects of fed tightening are weighing on the growth outlook. Globally, economic data continues to soften, We are heading into a late cycle bear market and there is not much in the policy toolbox to change that though the Fed will try. We do expect Congress to pass a massive infrastructure bill, but frankly there are not enough people to fill the potential new jobs. Japan is cheap and has some great dividend payers. They have been the poster child for anemic growth for decades. Sadly, the US is heading in this direction along with most of the developed world and China that is rapidly aging. There are policy tools to fix the issues, but politically impossible to implement because it largely involves austerity budgets and reduction of promises (benefits) which makes it near impossible to implement. We will tend to shift money to places like Japan and the UK that have good dividend payers and much better valuations. Emerging markets has some of these exposures too along with tilting towards a weaker US dollar scenario as the Fed will need to take rates to zero again while the rest of the developed world cannot get off of them. Low beta, low volatility, value, high dividend, high quality are all relatively attractive. Option strategies to enhance yield will play a big role as well in recessionary portfolio construction. Currency exposure will be a significant contributor as well. We cut exposure to Canada (ZCN, ZWU) last week as we are increasingly negative heading into a recession.

Fixed-Income/Currency/Commodity Strategy & Trades

It is clear to us that we are heading for a recession and a prolonged bear market environment. Historically, bonds and duration will play an increasing role in portfolio construction and capital preservation. We have started to nibble at Emerging Market Local currency government debt (EMLC). This is a growth at a reasonable price portfolio and we will increasingly seek to grow the portfolio with duration exposure. As the Fed looks to cut rates, gold exposure should provide some growth as well. A weaker US dollar trend will see us shift assets to higher yielding currencies as well. emerging market local currency debt seems particularly attractive. As for the C\$, we see it below 70 cents at the trough of the next recession and it should struggle to move above 78 cents. We added to US\$ exposure last week above 75 cents and expect that we see 70 cents before we see 78 cents.

1 Benchmark is the return of the targeted portfolio 100% global equities hedged to Canadian dollars; 2 Beta is a measure of how a fund responds to moves in the broader market. A beta of greater than 1.0 suggests that the fund is more volatile than the market, while a beta of less than 1.0 suggests that the fund is less volatile. 3 Yield is the most recent income received by the fund in the form of dividends, interest and other income annualized based on the payment frequency, divided by the current market value of the fund's investments. 4 Volatility is the annualized standard deviation which is a measure of risk. 5 Upside/Downside is a statistical measure of how much of the fund performance a manager captured during up-markets or down-markets. Typically, an investor would prefer a higher upside capture and lower downside capture. The time period presented is since inception. 6 Standard Deviation is a measure of risk that calculates the variation of a fund's performance around its average over a specific time period. © "BMO (M-bar roundel)" is a registered trade-mark of Bank of Montreal, used under licence.
