Market Strategy (Risk Management)

DEFENSE: The current beta is 34.1% vs. the benchmark of 74.7% and down from 34.3% last week. S&P 2800 is establishing itself as a major pivot. Buyers above will turn to sellers below soon. There is nothing but air for support to the 2650-2700 range, though the 200-day average around 2775 might slow it down for an hour or two. The market is still too optimistic regarding a trade deal. We expect China to play hardball owning to Trump's re-election risks. Sadly, the trade wars are just beginning. The question swill be who blinks first. 25% tariffs will most likely push the S&P 500 back to and through the December lows, where Trump will be forced to make a deal and the Fed will be cutting rates. We look to get more defensive as we approach the late June G20 Xi-Trump meeting.

Country Allocation & Trades

What is the portfolio construction that will give us a good yield and preserve capital in a global recession? Europe is a mess and has no long-term chance to be fixed with a negative rate policy and no fiscal union. While fundamentally cheaper from a P\E perspective, it's a value trap of major proportions. Emerging markets have great relative valuation too, but carries 50% higher risk on a standard deviation basis. Japan has some great dividend payers and intrinsic relative and we have some exposure, but as the oldest (demographically speaking) economy in the world, they are the poster child for anaemic growth and QE that has not worked. Let's call it strategic nibbling in the regions where there is some relative value. In Canada, it looks increasingly like we will see a change in government in 2019 towards a more pro business and investment focus, however a global recession always sees Canada lag due to the high exposure to cyclicals (energy, mining). While the US is a fiscal mess, it's the best dirty shirt in the laundry. It's very expensive from an adjusted P\E perspective.

Sector/Style Trades

The Fed told us recently by slowing and then stopping the balance sheet run-off that we are heading for a recession and the yield curve is confirming this outlook. Defensive styles with greater use of enhanced yield with options strategies make massive sense. We will keep beta as low as possible while generating a 4% yield. High quality exposure with low volatility along with option based yield enhancements to ride out the end of the cycle. If you have any better ideas, please let us know. We added to long UST exposure again last week (TLT) as yields have backed up a bit. Historically, a long duration bet offers significant capital gains potential. At a minimum, we retest the yield lows from BREXIT, which for now has been marked as the secular bull market low yield by many. In the next recession, sadly, we expect yields will go even lower. Those suggesting the bond bull has needed have not studied the history of debt. Central banks will have little choice but to monetize the debt going forward. Modern Monetary Theory is gaining traction with the political LEFT as more people get LEFT behind. Trump is trying to #MAGA, but he's only making it worse by adding to the debt accelerating the need to monetize the debt. QE to infinity should be supportive for market liquidity. The FOMC backing off on rate hikes and unwinding the balance sheet reminds us how fragile the world is to rate normalization and this liquidity and debt induced growth.

Currency Strategy & Trades

The Fed basically capitulated on "financial conditions (read equity market weakness)" and the US 3M-10Y curve inverted. We are heading into a recession in the next 12+ months and the C$ is likely heading below 70 cents and possibly towards all-time lows around 62 cents. The only question is how fast does it get there. We have moved our target ranges to 76-70 cents for now and will be more aggressive adding US$ exposure during periods of C$ strength.

1 The benchmark is the return of the targeted portfolio. As of Jan 1, 2017, the target portfolio is 80% (CYH) and 20% (ZDV); 2 Beta is a measure of how a fund responds to moves in the broader market. A beta of greater than 1.0 suggests that the fund is more volatile than the market, while a beta of less than 1.0 suggests that the fund is less volatile. 3 Yield is the most recent income received by the fund in the form of dividends, interest and other income annualized based on the payment frequency, divided by the current market value of the fund's investments. 4 Volatility is the annualized standard deviation which is a measure of risk. 5 Upside/Downside is a statistical measure of how much of the fund performance a manager captured during up-markets or down-markets. Typically, an investor would prefer a higher upside capture and lower downside capture. The time period presented is since inception. 6 Standard Deviation is a measure of risk that calculates the variation of a fund's performance around its average over a specific time period.
