Annualized SI	2.81%	4.73%		
Sharpe Ratio	0.75			

Market Strategy (Risk Management)

DEFENSE: The current beta is 10.6% vs. the benchmark of 55.4% down from 11.0% last week. Despite the fact that global equity markets fell about 6% in May, we still see more downside before any meaningful bounce. We are in bear market capital preservation mode, which means our goal is to have positive returns even as equities are declining. A focus on higher yielding sectors and investment styles along with tactical shifts in currency, duration, and credit exposures. We have more tools than most traditional balanced portfolios. At 2.60%, US 30 year bonds are in an area where risk-reward is not attractive. That said, the extreme low yields seen in the post BREXIT period are likely targets too as the full recession plays out into 2020. According to the NY Fed recession probability index 12 months forward, "WE ARE THERE!" Main Street does not believe it until jobs start to leave, which is a lagging indicator and typically the last shoe to drop. The US likely added about 180K jobs last month, so it does not feel like it yet. It will show up in margin presures before it shows up on Main Street.

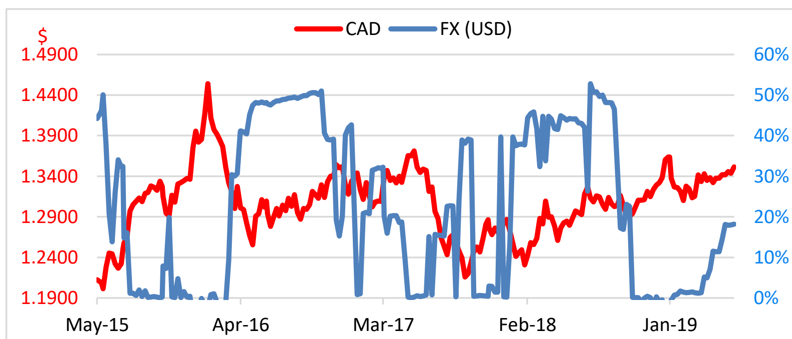
Equity Country/Sector Allocation & Trades

We are not concerned about a new bull market developing. The markets are excited about a trade resolution and a dovish Fed. Nevertheless, the global economy continues to slow and the lagged impact of tighter policy will likely have negative impacts for growth. The global economy is only growing based on leverage and easy money. In the long run, we are seeing huge misallocation of capital and the credit bubble that's building will likely end badly. China may be at the front of that wave with the credit risk of the S&P 500 flirting with the biggest credit bubble in history. To say we are a growth skeptic would be an understatement. For the next several years, tactical asset allocation may be our only real return possibility. Europe is cheap because it's a house of cards with its strongest economy, Germany, basically in a recession. EM is cheap because it's leveraged to Europe. The US is overvalued because it's the only economy that's working, but that's been 100% leverage for the past decade with free money, which is coming to an end--especially with the political shift to the LEFT that could leak in more inflation than the debt load can handle.

Currency Strategy & Trades

We have moved our U$ target over the next year to 76-70 cents with a bias towards the ALL-TIME low of 62 cents by the time the global recession plays out. Twin deficits and stupidity in Ottawa are the catalysts along with world energy prices collapsing in the downturn. We look to build US$ exposure towards 50% of the portfolio in the coming months. That would push the beta of the portfolio to negative levels where we hope to have positive returns as the bear plays out.



Fixed-Income/Commodity Allocation & Trades

The most important consideration in our fixed-income portfolio is interest-rate sensitivity versus the benchmark of 6.21. The duration of the portfolio is 2.27 down -1.04 last week. The idea that the FOMC will have to cut rates with the unemployment rate below 4% is a gross mispricing of risks. That said, it underscores how fragile the global economy is with the real yield on the entire world of fixed income negative and we cannot normalize. Worse yet, the 2020 US election will see the Democrats looking to spend bags of money as the DEBT troubles escalate. You would think that would all be bearish for bonds yet the long end of the curve is anchored. Gold should still provide a stable store of value and makes sense to own during periods of weakness. We will be accumulating more exposure here too.

1 Benchmark is the return of the targeted portfolio 60% global equities and 40% global bonds hedged to Canadian dollars; 2 Beta is a measure of how a fund responds to moves in the broader market. A beta of greater than 1.0 suggests that the fund is more volatile than the market, while a beta of less than 1.0 suggests that the fund is less volatile. 3 Yield is the most recent income received by the fund in the form of dividends, interest and other income annualized based on the payment frequency, divided by the current market value of the fund's investments. 4 Volatility is the annualized standard deviation which is a measure of risk. 5 Upside/Downside is a statistical measure of how much of the fund performance a manager captured during up-markets or down-markets. Typically, an investor would prefer a higher upside capture and lower downside capture. The time period presented is since inception. 6 Standard Deviation is a measure of risk that calculates the variation of a fund's performance around its average over a specific time period.
