Market Strategy (Risk Management)

DEFENSE: The current beta is 29.9% vs. the benchmark of 75.2% and down from 32.1% last week. We remain extremely defensive with the US markets at all-time highs off another liquidity boost from the FOMC. The global economy is so growth challenged and fragile that the FOMC needs to consider a pre-emptive rate cut with no inflation pressure and full employment. The Phillips curve is so far off it's predictive power, this time is different. That suggests just about anything is possible in terms of market outcomes. As of today, the estimated earnings decline for the second quarter for the S&P 500 stands at -2.6%. If -2.6% is the actual earnings decline for the quarter, it will mark the first time the index has reported two straight quarters of year-over-year declines in earnings since Q1 2016 and Q2 2016. It will also mark the largest year-over-year decline in earnings since Q2 2016 (-3.2%).

Country Allocation & Trades

What is the portfolio construction that will give us a good yield and preserve capital in a global recession? Europe is a mess and has no long-term chance to be fixed with a negative rate policy and no fiscal union. While fundamentally cheaper from a P/E perspective, it's a value trap of major proportions. Emerging markets have great relative valuation too, but carries 50% higher risk on a standard deviation basis. Japan has some great dividend payers and intrinsic relative value and we have some exposure. However, it's the oldest (demographically speaking) economy in the world and they are the poster child for anaemic growth and QE that has not worked. Let's call it strategic nibbling in the regions where there is some relative value. In Canada, it looks increasingly like we will see a change in government in 2019 towards a more pro business and investment focus, however a global recession always sees Canada lag due to the high exposure to cyclicals (energy, mining). While the US is a fiscal mess, it's the best dirty shirt in the laundry, though it's very expensive from an adjusted P/E perspective. The best investment skill we know is patience. Higher yield and lower volatility portfolio (sleep-at-night) is where we will sit clipping coupons and dividends until risk-adjusted returns improve.

Sector/Style Trades

The Fed told us this week they are going to need to cut rates after the smallest rate hike cycle in history. Inflation pressures are weak and we are at full employment. While the glass half full view says that's a Goldilocks scenario, the glass half empty view says the world is growth challenged and it's only low rates and increasing leverage keeping the party going. That's not a Goldilocks foundation, it's House of Cards foundation. We took profits on our long bond exposure as it is an extremely crowded trade. But we will come back to it as yields rise a bit. The US 10-year will struggle to move below 2% until the economy actually breaks, so we are using that hurdle as major resistance for now. A break below 2% targets the post BREXIT lows at 1.32% and likely a 10-year below 1%. Extracting yield from duration is still a big part of the next year plus in markets, but for now we expect a pullback. We do not have big exposure to the traditional defensive sectors like staples and utilities given their massive over value. We see the defensive aspects of gold equities still good for another 20-25% upside.

Currency Strategy & Trades

The Fed basically capitulated on "financial conditions (read equity market weakness)" and the US 3M-10Y curve is inverted. We are heading into a recession in the next 12+ months and the C\$ is likely heading below 70 cents and possibly towards all-time lows around 62 cents. The only question is how fast does it get there. We have moved our target ranges to 76-70 cents for now and will be more aggressive adding US\$ exposure during periods of C\$ strength. We added back US\$ exposure last week.

1 The benchmark is the return of the targeted portfolio. As of Jan 1, 2017, the target portfolio is 80% (CYH) and 20% (ZDV); 2 Beta is a measure of how a fund responds to moves in the broader market. A beta of greater than 1.0 suggests that the fund is more volatile than the market, while a beta of less than 1.0 suggests that the fund is less volatile. 3 Yield is the most recent income received by the fund in the form of dividends, interest and other income annualized based on the payment frequency, divided by the current market value of the fund's investments. 4 Volatility is the annualized standard deviation which is a measure of risk. 5 Upside/Downside is a statistical measure of how much of the fund performance a manager captured during up-markets or down-markets. Typically, an investor would prefer a higher upside capture and lower downside capture. The time period presented is since inception. 6 Standard Deviation is a measure of risk that calculates the variation of a fund's performance around its average over a specific time period. * "BMO (M-bar roundel)" is a registered trade-mark of Bank of Montreal, used under licence.
